ADP, ATP carrier protein T1 - mouse

N:Alternate names: adenine nucleotide car

C:Species: Mus musculus (house mouse)

C:Date: 06-Jan-1995 #sequence_revision 06

C:Accession: S37210

R:Laplace, C.: Costet, P.

submitted to the EMBL Data Library, Septe

A:Reference number: S37210

A:Accession: S37210

ANT is a nuclear encoded protein and a major component of conner mitochondrial membrane. It mediates transport of adenosine cdi/tri-phosphates across the mitochondrial inner membrane and also serves an important molecular component of the mitochondrial permeability can important molecular component of the mitochondrial permeability consists an important molecular component of the mitochondrial permeability or ligands that bind to, or interact with it. The ANT ligands are used to detect or isolate ANT in a biological sample, and therapeutically for cregulating mitochondrial pore activity, for treating diseases associated with altered mitochondrial function, including Alzheimer's, parkinson's and untington's diseases, cancer, psoriasis, diabetes, dystonia, concer's hereditary optic neuropathy, schizophrenia, mitochondrial concephalopathy, lactic acidosis and stroke (MELAS), hyperproliferative cdisorders, mitochondrial diabetes and deafness (MIDD), and myoclonic epilepsy red ragged fibre syndrome. The present sequence is an adenine nucleotide translocator ANT3 from human brain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches

                                                                                                                                                                                                                                                                                                           immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activinyinhibin activity, chemotactic/chemokinetic activity, hemotactic/chemokinetic activity, hemotactic/chemokinetic activity, assays for receptor activity, arthritis and inflammation, leukaemias and

                                                                                                                                                                                  The present sequence represents human adenine nucleotide translocator 3
(ANT-3) protein. ANT proteins are mitochondrial permeability
transition (MTP) pore components responsible for mediating transport
of ADP across the mitochondrial inner membrane. ANT proteins interact
with other mitochondrial core components e.g. cyclophilins to
regulate MPT. The present invention relates to a novel nucleic acid
expression construct comprising a promoter operably linked to a
cyclophyline encoding a mitochondrial pore component polypeptide
(e.g. ANT) fused to an energy transfer molecule (ETM) protein
(e.g. ANT) fused to an energy transfer molecule (ETM) protein
cyclopy area fluorescent protein (GFP) or a FLASH sequence). The novel
expression construct can alter mitochondrial membrane permeability
transition and/or alter the interaction between mitochondrial core
components. The methods are useful for screening for agents that alter
MFT and/or cell survival. These agents are useful for the prevention or
dysfunctional cell survival, such as Alzheimer's disease, diabetes

29-NOV-2000;
                 The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     peripheral nervous system; neuropathy; central nervous system; Calzheimer's; Parkinson's disease; Huntington's disease; haemosta amyotrophic lateral sclerosis; Shy-Drager Syndrome; chemotactic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            09-JUL-2000;

The patent discloses a method to produce adenine nucleotide translocator (ANT) proteins or ANT fusion proteins using recombinant expression constructs. ANT is a nuclear encoded protein and a major component of inner mitochondrial membrane. It mediates transport of adenosine dlytri-phosphates across the mitochondrial inner membrane and also serves as an important molecular component of the mitochondrial permeability transition pore, a modulator of apoptosis. ANT is used to identify agents or ligands that bind to, or interact with it. The ANT ligands are used to detect or isolate ANT in a biological sample, and therapeutically for regulating mitochondrial pore activity for treating diseases associated with altered mitochondrial function, including Alzheimer's, Parkinson's and Huntington's diseases, cancer, psoriasis, diabetes, dystonia, Leber's hereditary optic neuropathy, schizophrenia, mitochondrial conditions and stroke (MELAS), hyperproliferative diseases, mitochondrial function.
                                                                            disorders, mitochondrial diabetes and deafness (MIDD), and epilepsy red ragged fibre syndrome. The present sequence is adenine nucleotide translocator ANT2 from human brain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim

                                                                                                                                                                                                                                                                                                                                                                                                   with other mitochondrial core components e.g. cyclophilins to
cregulate MPT. The present invention relates to a novel nucleic acid
expression construct comprising a promoter operably linked to a
component polypeptide
ce.g. any, fused to an energy transfer molecule (ETM) protein
ce.g. any, fused to an energy transfer molecule (ETM) protein
ce.g. any, fused to an energy transfer molecule (ETM) protein
ce.g. any, fused to an energy transfer molecule (ETM) protein
ce.g. any, fused to an energy transfer molecule (ETM) protein
cexpression construct can alter mitochondrial membrane permeability
transition and/or alter the interaction between mitochondrial core
components. The methods are useful for screening for agents that alter
treatment of diseases associated with altered mitochondrial function or
dysfunctional cell survival, such as Alzheimer's disease, diabetes
mellitus, Parkinson's disease, Huntington's disease, schizophrenia,
cmitochondrial encephalopathy, lactic acidosis, stroke,
cmitochondrialerative disorders e.g. cancer, and deafness.

The Antl cDNA sequence was determined by DNA Taq dideoxy terminator cycle sequencing. The Antl protein is encoded by the Antl locus, a nuclear gene on chromosome 8. This protein is required in mitochondrial oxidative phosphorylation (OXPHOS), as it imports ADP which can then be converted into ATP. An Antl homozygous mutant would thus be defective in OXPHOS which results in disease in oxidative metabolism dependent tissues. This mouse Antl homozygous mutant can be used as a model system for fascioscapular humeral muscular dystrophy, hypertrophic cardiomyopathy, mopathy, lactic acidosis, etc. These model systems can be used to test possible therapeutic compounds which increase/mediate ATP and ADP exchange across the mitochondrial membrane
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Mice lacking heart-muscle adenine nucleotide translocator protein useful as model for mitochondrial myopathy and hypertrophic cardiomyopathy in animals and to test therapeutic compositions or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ₽
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   B
              di/tri-phosphates across the mitochondrial inner membrane and also serves as an important molecular component of the mitochondrial permeability transition pore, a modulator of apoptosis. ANT is used to identify agents or ligands that bind to, or interact with it. The ANT ligands are used to detect or isolate ANT in a biological sample, and therapeutically for regulating mitochondrial pore activity, for treating diseases associated with altered mitochondrial function, including Alzheimer's, Parkinson's and Huntington's diseases, cancer, psociasis, diabetes, dystonia, Leber's hereditary optic neuropathy, schizophrenia, mitochondrial encephalopathy, lactic acidosis and stroke (MELAS), hyperproliferative disorders, mitochondrial diabetes and deafness (MIDD), and myoclonic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; adenine nucleotide translocator; ANT1; mitochondria; ADP; ATP; adenosine di-phosphate; adenosine tri-phosphate; apoptosis; MPT; cancer; mitochondrial permeability transition; neuroprotective; notropic; antiParkinsonian; cytostatic; antidiabetic; anticonvulsant; neuroleptic; antiParkinsonian; cytostatic; antidiabetic; screening; psoriasis; altielmer's disease; Parkinson's disease; Huntington's disease; dystonia, diabetes; Leber's hereditary optic neuropathy; schizophrenia; MELAS; mitochondrial diabetes and deafness; hyperproliferative disorder; myoclonic epilepsy red ragged fibre syndrome.
                                                                                                                                                                                                          constructs. ANT is a nuclear encoded protein and a major component of inner mitochondrial membrane. It mediates transport of adenosine
                                                                                                                                                                                                                                                           The patent discloses a method to produce adenine nucleotide translocator
                                                                                                                                                                                                                                                                                                Claim 44;
                                                                                                                                                                                                                                                                                                                             Recombinant construct encoding adenine polypeptide, useful e.g. in screening f against mitochondrial disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Anderson CM,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               (e.g. ANT) fused to an energy transfer molecule (ETM) protein (e.g. green fluorescent protein (GFP) or a FLASH sequence). The novel expression construct can alter mitochondrial membrane permeability transition and/or alter the interaction between mitochondrial core components. The methods are useful for screening for agents that alter manual cortice that alter and/or cell survival. These agents are useful for the prevention or treatment of diseases associated with altered mitochondrial function or dysfunctional cell survival, such as Alzheimer's disease, diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         of ADP across the mitochondrial inner membrane. ANT proteins interact with other mitochondrial core components e.g. cyclophilins to regulate MPT. The present invention relates to a novel nucleic acid expression construct comprising a promoter operably linked to a polynuclectide encoding a mitochondrial pore component polypeptide
                                                                                                                                                                                                               Moss; carbohydrate metabolism related protein; CMRP; sugar; cofactor; fine chemical production; carbohydrate; polysaccharide.
                                                                                                                                                                                                                                                        ADP/ATP carrier protein sequence #174.
                                                                                                                                                                                                                                                                                                                                      AAM00106 standard; Protein; 386 AA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         mellitus, Parkinson's disease, Huntington's disease, schizophrenia, mitochondrial encephalopathy, lactic acidosis, stroke, hyperproliferative disorders e.g. cancer, and deafness.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 of ADP across the mitochondrial inner membrane.

and/or enzymes. The nucleic acid molecules are suitable for modifying a carbohydrate production system in a host, e.g., microorganisms and plants. They are also useful to identify those DNA sequences and enzymes in other species which are useful to modify the biosynthesis of starch, cell wall polysaccharides and sugars. The nucleic acid molecules may be utilised in the genetic engineering of Corynebacterium glutamicum and the related Brevibactelum species and Acetobacter xylinum and Chlorella to make it a better or more efficient producer of one or more fine chemicals. Mutagenesis of one or more CMRPs may also result in CMRPs having altered activities which indirectly impact the production of one or more desired fine chemicals from plants. Primers AAH88707 - AAH80707
                                                                                                                                                                                                                                                                                                                                                                                         Included in the invention is a vector containing the CMRP cDNA, and a host cell transformed with the vector. The host cell (a microorganism, Corynebacterium or Brevibacterium, moss or algae or a plant cell) is useful for producing a fine chemical such as carbohydrates, cofactors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel moss nucleic acid molecules encoding a carbohydrate metabolism related protein useful for modulating production of fine chemicals such as carbohydrates, cofactors and enzymes from microorganisms and plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention relates to nucleic acid molecules AAH88708 - AAH88796 isolated from Physcomitrella patens (a moss), which encode carbohydrate metabolism related proteins (CMRP) represented in AAM00022 - AAM00110.
                                                  are used in the sequencing of the CMRP cDNA sequences of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 30; Page 131; 133pp; English.
